

It has come to my attention that a form of Internet service is about to be tested over existing power lines. It would appear that the interference from such activity would render the HF bands useless to Amateur Radio operators as well as other users of these frequencies. As I'm sure you are aware during times of emergency amateur radio stations provide vital communications when other systems fail. Allowing interference to these stations would hamper emergency communications or eliminate them all together. This can not be allowed to happen.

Thank you,
Ronald R Rugg
